Abstract

This catalogue lists the NOAA/AVHRR satellite data received by the joint WAIT/CSIRO satellite facility in Perth, Western Australia, over the period 1981-1987. A bibliography of papers and reports based on this unique data set is appended.

Catalogue of NOAA-AVHRR Data

The first Australian receiving station for data from the Advanced Very High Resolution Radiometer (AVHRR) on the NOAA series of environmental satellites was established in Perth towards the end of 1981. Since that time, over 1200 passes have been received and archived. At the end of 1987, however, a new satellite station was set up under the auspices of WASTAC (Western Australian Satellite Technology and Applications Consortium) to replace the ageing original facility.

This report documents the establishment and development of the facility, and catalogues the archived passes between 1981 and 1987 as a permanent record of the tapes available. The data on these tapes are expected to be of immense value to a wide variety of users into the future.

Historical Background

During the late 1970s, the School of Electrical and Electronic Engineering at the Western Australian Institute of Technology (WAIT, now Curtin University of Technology) designed and built a GMS satellite data receiving facility on the institute's campus at Bentley, south of Perth, under the direction of Dr Bill Carroll (WASTAC 1987).

Since 1978, the Remote Sensing Group of the CSIRO Division of Land Resources Management at Floreat Park (Perth) had been working with NOAA/TIROS-N data obtained from the United States for a preliminary study of the ocean circulation off Western Australia. To overcome the difficulties and delays in acquiring tapes by this method, Dr Frank Honey of the CSIRO group discussed with Bill Carroll the possibility of establishing a local NOAA/AVHRR receiving station. In 1980/81 the GMS facility at Bentley was upgraded to receive AVHRR data. This joint CSIRO/WAIT project (Carroll 1982) thus established the first AVHRR receiving station in Australia (and, indeed, one of the first in the world). Despite a host of apocryphal tales that have circulated about the origins of the receiver, it was in fact designed and constructed at the Institute of Technology, and (for cost-effectiveness) was mounted on a Bofors gun-mount.

From here began a series of early-morning starts with a crew, often comprising students, manually operating the somewhat clumsy facility. The first pass in the present archive is dated 20 August 1981, from the NOAA-6 satellite. The quality of data from those first passes was not always good, but scribbled comments on some of the tape labels bear testimony to the communal delight when a really good pass was successfully received. Some of those early images of the Leeuwin Current remain among the finest available.

Over the years, student projects at WAIT have played an important role in building up the facility. Initially, only every second line of data (and indeed only 1780 of the 2048 pixels in each scan-line) could be acquired because of limitations in the transmission system. Both the software and hardware for acquiring the data were progressively refined, however, and by mid-1983 the full data set (i.e. all lines, containing all 2048 pixels) was being received regularly. As the 1600 bpi tapes can hold only some 2800 lines of data, the portion of the image actually archived on tape was between the latitudes of approximately 10 and 40 degrees south; this adequately covers the Australian continent and adjacent waters. (Because of the tedium of the manually operated receiver, a fully automatic station was envisaged from the beginning.)

A second-hand receiving dish was procured from the United States satellite station at Carnarvon, but with declining funds and technical problems with the sheer weight of the dish, that fully automatic station never came to fruition.

Most of the funding for the initial establishment of the facility was provided by the Fishing Industry Research Trust Account (FIRTA) for the imagery to be used in a study of the relationship between tuna catches and sea-surface temperatures off the south coast of Western Australia (Myers and Hick 1985). Subsequent funding over the years has come from the Marine Sciences and Technologies (MST) Grant scheme, with grants to apply the data to studying cyclone activity and oceanic processes on the North-West Shelf, and to the structure and behaviour of the Leeuwin Current.

Some highlights of the imagery include detection of a cloud of volcanic ash (which almost brought down a British Airways jumbo jet north of Australia by clogging its engines), pictures showing the extent of severe flooding of the Fitzroy River, and sea-surface temperature images revealing the complex of eddies and meanders that comprise the Leeuwin Current.

By 1984, the two leading investigators had left the scene and operation of the WAIT receiver came under the control of Dr Doug Myers. With extensive support from his electronics team, Doug has spent a large proportion of his time and energy seeking funding for maintaining the increasingly temperamental facility at WAIT. In later years, the efforts of Mahn Young have made possible the continuous acquisition of data to the archive. The Remote Sensing Group at Floreat Park came under the direction of Dr Fred Prata, who had been a research fellow at WAIT and was developing a major computer package specifically for processing AVHRR data for SST retrievals and image geolocation. This program (PESST, or Procedure for Estimating Sea-Surface Temperature; Prata 1985) was implemented at the Floreat Park facility, where it is routinely used for processing and displaying NOAA/AVHRR imagery.

The original Curtin University receiver has now been replaced by the new WASTAC facility, although for a period at the end of 1987, WASTAC continued to acquire data from the old receiver while the new station was being established. The last pre-WASTAC pass was from NOAA-9 on 25 September 1987.

Orbital characteristics of the NOAA satellites

The swath width of a NOAA/AVHRR pass is some 2900 km, comprising 2048 pixels each 1.1 km square (sub-satellite point). The ellipse of coverage from the Perth receiver is illustrated in Figure 1 (Carroll 1982). Because of the curvature and rotation of the earth, the images are greatly distorted at the edges, and must be geo-located and remapped for detailed analysis.

Ascending orbits (south-to-north) of the odd-numbered series of satellites (NOAA-7 and -9) occur in the early afternoon local time; the descending passes (north-to-south) occur soon after midnight. For the even-numbered satellites (NOAA-6, -8 and -10), the ascending passes are around dusk and the descending orbits about dawn (Table 1). As two satellites are scheduled to be orbiting at all times, four nominal overhead passes can be acquired each day; however, as the receiver can also acquire data from adjacent passes, a total of 12 passes per day can

theoretically be received. Because of staffing and other operational limitations, generally one pass has been taken each afternoon, but night-time or weekend passes have been taken irregularly for special purposes.

Table 1: Approximate times (WA Standard Time) of ascending and descending passes (and number of archived tapes)

Satellite	Descending	Ascending
NOAA-6	0500–0900 (20)	1800–2200 (9)
NOAA-7	0000–0400 (53)	1300–1800 (702)
NOAA-8	0500–0900 (15)	1800–2000 (8)
NOAA-9	0000–0400 (20)	1300–1800 (426)
NOAA-10	0500–0900 (7)	1800–2200 (11)
TOTAL PASSES	115	1157

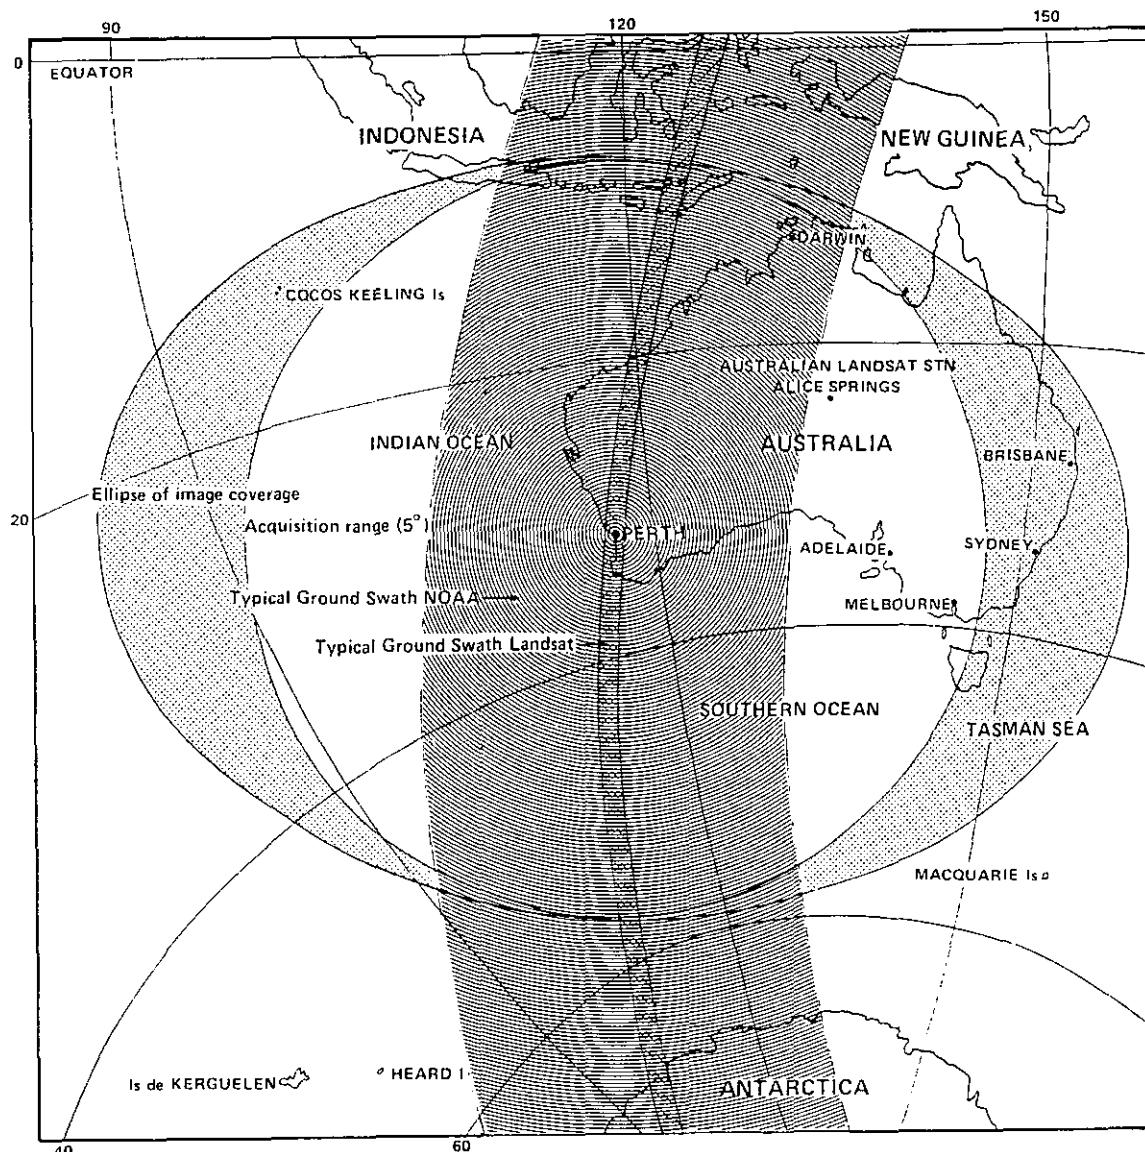

Figure 1: The area of coverage of the AVHRR receiver at Curtin University (after Carroll, 1982). The swath of a NOAA overhead pass is shaded, and the total possible coverage is indicated by the stippled ellipse. For comparison, the swath of a LANDSAT pass over Perth is hatched.

Data Format

The data are archived onto 2400 foot, half-inch, 1600 bits-per-inch (bpi) magnetic tapes, as an image of that transmitted by the satellite except for the pre- and post-sync pulses. A tape therefore contains all the data for every line received, including time-code, calibration information, and AVHRR/TOVS (Tiros Operational Vertical Sounder) etc. earth data. There are no headers, and triplets of the original 10-bit words have been packed into two 16-bit words (with two zero bits). The 5-channel data are in "Band-Interleaved-by-Pixel" (BIP) format, with channel 5 duplicating channel 4 for the even-numbered satellites (6, 8 and 10), which have a 4-channel instrument. The 10-bit quantization gives 1024 levels of dynamic range.

From the inception of the receiving facility, an attempt has been made to produce so-called "Quicklook" images showing the whole pass, as a "first-look" at the area covered and the cloud distribution. Initially, these were produced at Floreat Park in hard-copy photographic form, but subsequently 35 mm slides have been prepared at Curtin University. The format of these slides has gradually been improved over the years, but there are occasional gaps in the collection.

Description of the Catalogue

This catalogue contains basic information for each pass in the archive as a record of the dates/times and areas available. For each record, the data are:

Satellite/Orbit Number

Date (Day/Month/Year)

Pass time (W. Australian Standard Time, i.e. GMT-8 hours)

Maximum elevation (above the horizon, East or West)

Location:	FP	=	CSIRO Floreat Park
	CU	=	Curtin University
	CF	=	both at Curtin and Floreat
	ER	=	tape erased (poor quality)
	?	=	present location of tape unknown

Quicklook: Q if 35 mm Quicklook slide exists; otherwise blank

Comment: includes corrections, extra information, etc.

Gaps have been left where the information is either missing or clearly wrong.

The catalogue has been compiled from three main sources:

- (1) The primary source has been the tapes themselves, where available; however, the tape labels are not always legible or correct.
- (2) Various partial lists of orbits have been compiled from time-to-time by users, generally with a particular period and purpose in mind; the accuracy of this information depends on the dedication of the original authors of the lists.
- (3) The Quicklook slides, some of which contain relevant information, while others have been used solely to establish that the passes were taken and to estimate the approximate maximum elevation (and hence area of coverage).

As many tapes are at present missing (or perhaps erased), much of the data here has been compiled from only one of the above sources and some judgement has been required to resolve inconsistencies.

Every effort has been made to ensure that the information in this catalogue is correct (despite missing or illegible scribbles on the tape labels). Three checking routines have been applied:

- (1) A simple check for numerical sequence of orbits.
- (2) A date/time/orbit check, by interpolating between pairs of passes (say 6 months apart) and checking that the orbit numbers and dates/times of intermediate passes were correct. A number of errors have been found in this way, and where there is little doubt as to the correct information, it has been included in this catalogue. Because past image processing has used the information listed on the tapes, however, the original (incorrect) data are also given under "comments".
- (3) A check on the maximum elevation in relation to the start and end azimuth positions; this also enabled Easterly and Westerly passes to be distinguished (as the earlier data tapes rarely recorded this). Again, many apparent errors have been detected and (hopefully) corrected. Figure 2 shows the approximate ranges of start-and-end azimuths for ascending and descending passes. Where these are consistent with the maximum elevation as listed on the tape label, Easterly or Westerly passes have been assessed, but in some cases it has not been possible to determine the true overpass position.

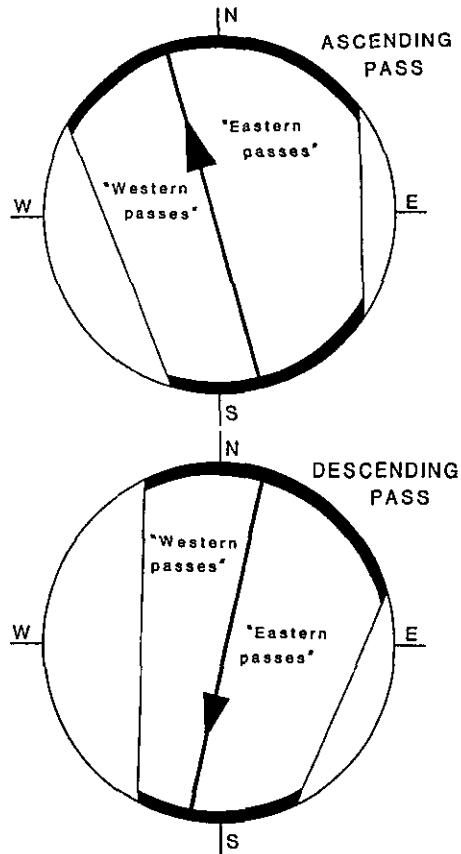

Figure 2: Approximate trajectories of NOAA ascending and descending passes over Western Australia.

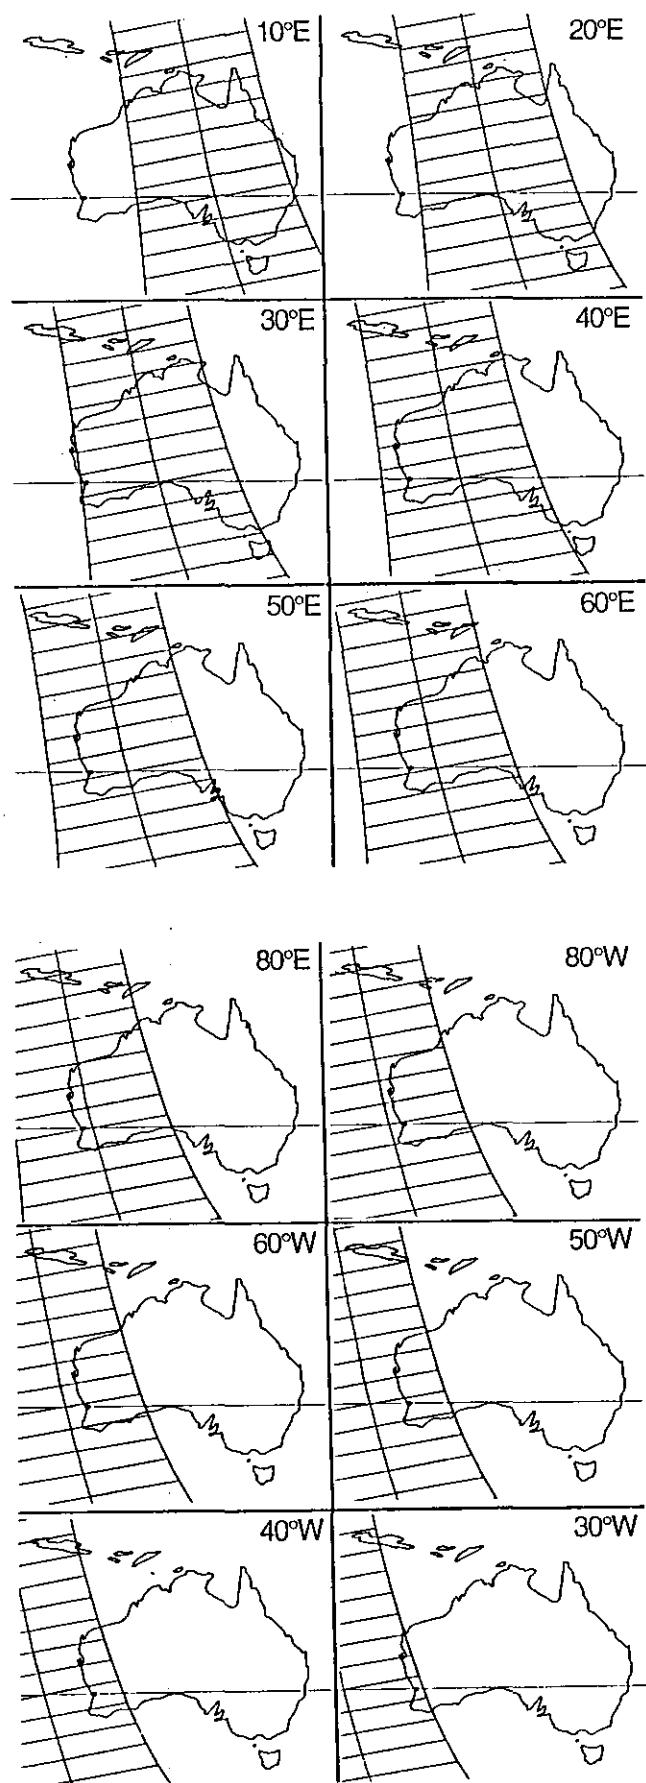

Figure 3: Relative positions of NOAA swaths for different maximum elevations of the satellite orbit.
E = Eastern passes, W = Western passes.

Availability of Data

The approximate positions of NOAA passes across Australia at varying elevations, both East and West, are shown in Figure 3 to indicate the data coverage. From this diagram, potential users can assess whether any particular pass covers their area of interest, allowing for cloudiness (no attempt has been made to quantify cloud cover here).

Of the 1270 passes listed here, 195 tapes are at present housed in the School of Electrical and Electronic Engineering at Curtin University and 897 at the CSIRO Division of Exploration Geoscience at Floreat Park. (A few tapes have been copied and exist at both institutions.) The respective custodians are Dr Doug Meyers and Mr Richard Stuart.

At least 32 tapes have been erased (because of extremely poor quality data; the tapes were then re-used), while the remaining 141 may either have been erased or are stashed away in offices somewhere! It is hoped that these tapes will be returned to complete the archive.

A more complete database of this archive is held on an IBM-compatible computer at Floreat Park, Curtin University, the WASTAC office and the CSIRO Division of Oceanography at Marmion. The full database contains the information in this catalogue as well as the start- and end-azimuths and the equatorial longitude and crossing time (used in geolocation of the imagery).

Quicklook collections are maintained at Curtin University, CSIRO Floreat Park, CSIRO Division of Oceanography at Marmion (Perth), and the WASTAC office at the Western Australian Department of Land Administration (Remote Sensing Applications Centre).

Acknowledgements

The scientific industrial communities in Western Australia owe much to the foresight of the pioneers Frank Honey and Bill Carroll in establishing the satellite station in Perth, to Doug Meyers and Fred Prata for maintaining and further developing the facilities, and to the teams of technical assistants operating the system.

In producing this report, I am grateful to Valerie Pearce and Deborah Murray for many hours spent sorting and checking the thousand-plus tapes in the archive, and to Steven Pearce for entering all the data into the database.

Bibliography

Atmospheric

As an indication of the range of scientific interests the existing archive caters to, this list is a (non-exhaustive) guide to papers and reports that have used the imagery.

Hille, R. J., van Burgel, J. L., Lynch, M. J. & Prata, A. J. (1986) Application of NOAA satellite data to the study of tropical cyclones. Proceedings of the First Australian AVHRR Conference, Perth, 22–24 October 1986, 108–115.

Lynch, M. J., Prata, A. J. & Penrose, J. D. (1985) Status of surface temperature measurement and its impact upon atmospheric soundings. Second International TOVS Conference, Austria, 18–22 February 1985.

Prata, A. J. (1985) Processing TIROS Operational Vertical Sounder data: theory and practice. Western Australian Institute of Technology, School of Physics and Geosciences, Report No SPG 386/1985/AP99.

Prata, A. J. & Lynch, M. J. (1985) Satellite radiance measurements of tropical cyclones. Extended Abstracts of Second Australian Conference on Tropical Meteorology, Perth, 43–45.

Prata, A. J., Lynch, M. J., Hille, R. J. & van Burgel, J. L. (1986) Observations of tropical cyclones in Western Australia using combined TOVS and AVHRR radiances. Proceedings of the Third International TOVS Study Conference, Madison, Wisconsin, 13–19 August 1986.

Barton, I. J. & Penrose, J. D. (1988) Experimental investigations of bulk/skin temperature differences in the open ocean. Abstracts of the Second Conference on Air–Sea Interaction, Merimbula NSW, 14–17 February 1988.

Griffiths, R. W. & Pearce, A. F. (1985) Satellite images of an unstable warm eddy derived from the Leeuwin Current. *Deep-Sea Research* 32(11), 1371–1380.

Griffiths, R. W. & Pearce, A. F. (1985) Instability and eddy pairs on the Leeuwin Current south of Australia. *Deep-Sea Research* 32(12), 1511–1534.

Griffiths, R. W. & Pearce, A. F. (1985) Instability and eddy pairs on the Leeuwin Current. Abstract, Australian Physical Oceanography Conference, Hobart, 11–15 February 1985.

Hearn, C. J. & Pearce, A. F. (1985) NOAA satellite imagery and airborne remote sensing of a small-scale tidal jet. *Australian Journal of Marine and Freshwater Research* 36(5), 643–653.

Lynch, M. J., Prata, A. J. & Hunter, J. R. (1986) Sea surface temperature anomalies off the North West Shelf of Western Australia. Proceedings of the First Australian AVHRR Conference, Perth, 22–24 October 1986, 259–268.
