Oceanographical Observations in the Pacific Ocean in 1964

H.M.A.S. Gascoyne

Cruise G1/64

January 13 - February 6, 1964

I. INTRODUCTION

This report records the data collected during the first cruise in 1964 of H.M.A.S. Gascoyne, Royal Australian Navy oceanographical frigate, in the Pacific Ocean.

Objectives

These were - to study the dynamics of the East Australian Current system; to study its chemical structure in relation to its dynamics; and to test a temperature-salinity-depth (TSD) recorder.

Itinerary

The cruise started at Sydney on January 13, worked four east-west sections north to about 28°S., then two east-west sections back to Sydney, from where the cruise continued on January 28 and worked four east-west sections south to Hobart (Fig. 1).

Scientific Personnel

B. Hamon (Cruise Leader)

F. Davies

K. Fleming

The analyses of hydrological samples were done in the ship's laboratory by Messrs Davies and Fleming. Nitrate analyses were done at Cronulla by Mr Prothero. TSD and GEK observations were made on board by Mr Hamon. The data were processed, under the direction of Mr Hedge, with computer programmes designed by Mr Crooks. The track chart was prepared by Mr Breach.

II. WORK ACCOMPLISHED

Eighty stations were worked (Gl/1/64 - Gl/80/64). Bathy-thermograph casts were made at 79 stations. Surface hydrology samples were collected at 29 stations, and surface and sub-surface at 51 stations. A GEK zero check was made at 75 stations.

III. METHOD OF COLLECTION AND ANALYSIS OF SAMPLES

1. Physics

Temperature.- Water temperatures were taken with deep-sea reversing thermometers; protected thermometers with a range of -2°C to 30°C, and unprotected thermometers with a range of -2°C to 30°C, or -4°C to 60°C. The accuracy of the temperatures is considered to be ± 0.03 deg C.

GEK.- The circuit and method of use were the same as given in CSIRO Aust. (1963). However, after Station 18 a course change, lasting 4 min, was made every hour, to obtain the total surface current.

Bathythermograms.- A 900 ft bathythermograph was used at each of the stations indicated in Table 1. A photograph of each slide is filed at Cronulla.

Thermometric Depth.- Depth calculations were made by the method described by Pollak (1950), and are considered accurate to ± 15 m at depths greater than 1000 m, and to 1% above that depth.

Sigma-t.- Sigma-t values were calculated, by computer, using the Table of Sigma-t given by La Fond (1951).

2. Chemistry

Salinity.- Salinity was measured on board with an inductive salinometer (Brown and Hamon 1961).

Dissolved Oxygen.- A version of the standard Winkler method was used to determine the amount of dissolved oxygen in the sea-water samples. The version used is a modification of that described by Thompson and Robinson (1939) and differs in some respects from the version by Jacobsen, Robinson, and Thompson (1950). Potassium iodate was used at the iodometric standard and the reagents necessary to fix the oxygen in solution were used at different concentrations. Duplicate titrations were made on approximately every tenth sample. Saturation values were calculated, by computer, using the simpler of the equations given by Richards and Corwin (1956) -

$$\text{O}_2 (\% \text{ Satn.}) = \frac{\text{O}_2 (\text{ml/l}) \times (33.5 + T^\circ\text{C}) \times 100}{332.4 - (1.854 \times S\%)} \cdot$$

Inorganic Phosphate.- The method of Atkins (1923) was used with 1 ml molybdate reagent (300 ml 10% w/v ammonium molybdate and 100 ml 50% v/v sulphuric acid) and 0.1 ml 1% w/v stannous chloride diluted afresh from a 40% stock solution in hydrochloric acid, which was kept under paraffin. The reagents were automatically dispensed by a piston dispenser.

Standard phosphate solutions were made up in distilled water. At air temperatures less than 25°C analyses were carried out in batches of 10; readings were begun within 10 min of adding reagents, and completed within 10 min. At air temperatures greater than 25°C batches of 6 were analysed; readings were begun within 5 min of adding reagents and completed within 7 min. Each batch was compared with a distilled water blank and a 0.65 µg-atom/l standard in a Hilger Spekker absorptiometer using 4 cm cells and Ilford 608 filters. Each day a complete calibration was made using standards up to 3.25 µg-atom/l. Results are given as µg-atom/l without any correction for salt error and are precise to $\pm 10\%$ for values less than 0.5 µg-atom/l and $\pm 5\%$ for higher values. To correct for salt effects, the results given can be multiplied by 1.15.

Total Phosphorus.- 100 ml samples were drawn from the Nansen bottles into 150 ml Pyrex conical flasks, 0.2 ml of 72% v/v perchloric acid was added and digestion at 200°-250°C carried out immediately on a sand tray. After evaporation of water, heating was continued until fuming of the salt residue

commenced. The samples were then allowed to cool and 100 ml of distilled water and 2 drops of 2% w/v phenolphthalein were added. If alkaline, perchloric acid was added until a slight acidity persisted. The flasks were allowed to stand for about 24 hr to allow the salts to dissolve. Phosphate was then determined as described above for inorganic phosphate. Results are given as $\mu\text{g-atom/l}$, without salt correction. To correct for salt effects, the results given can be multiplied by 1.15.

Nitrate.- After collection, water samples were stored in plastic bottles and preserved with 2 drops of saturated HgCl_2 . Nitrate was determined at Cronulla by the strychnidine method (Rochford 1947). The reagent was prepared by the addition of 0.64 g strychnidine to a litre of nitrate-free sulphuric acid. 5 ml of this reagent were added, with minimum agitation, to 5 ml seawater or standard nitrate solution. The standards were made up in a mixture of equal volumes of artificial seawater and nitrate-free sulphuric acid. The standards and samples were shaken to distribute the reagent, and the colour developed for 2 hr. The solutions were read in a Unicam SP 600 spectrophotometer at a wavelength of $530 \text{ m}\mu$ using a 5 mm cell. Samples with an absorbance greater than that of the standard corresponding to 14.4 $\mu\text{g-atom/l}$ were diluted with artificial seawater - sulphuric acid mixture before reading. Results are given in $\mu\text{g-atom/l}$.
