OCEANOGRAPHICAL OBSERVATIONS IN THE INDIAN AND PACIFIC OCEANS IN 1964

H.M.A.S. GASCOYNE

Cruise G3/64

March 5-25, 1964

I. INTRODUCTION

This report records the data collected during the third cruise in 1964 of H.M.A.S. Gascoyne, Royal Australian Navy oceanographical frigate.

Objectives

This cruise was initially planned as a repeat of Cruise G1/64, to find out how much change in circulation had occurred in two months. There was not sufficient time to do this, so the objectives were restricted to relocating the eddy that had been found off Jervis Bay on Cruise G1/64, and studying changes in circulation between $32^{\circ}30'S.$ and $34^{\circ}S.$

Itinerary

The cruise began at Adelaide on March 5, and worked three stations to Hobart. From Hobart on March 11 a series of stations was worked north to Sydney. The cruise re-commenced at Sydney on March 18 and worked a series of east-west and north-south sections to $158^{\circ}E.$ off New South Wales (Fig. 1).

Scientific Personnel

B. Hamon (Cruise Leader)
R. Bradley (March 11-25)
F. de Castillejo
K. Fleming

The analyses of hydrological samples were done in the ship's laboratory by Messrs Bradley and Fleming. Nitrate analyses were done at Cronulla by Mr Prothero. G.E.K. observations were made on board by Mr Hamon.

The data were processed, under the direction of Mr Hedge, by Mrs Bailey, Miss Hammond, Mrs Sander, and Miss Wanstall. The track chart was prepared by Mr Breach.

II. WORK ACCOMPLISHED

Forty-five stations were worked (G3/116/64-G3/160/64). Bathy-thermograph casts were made at 34 stations. Surface hydrology samples were collected at 18 stations, and surface and subsurface at 25 stations. A GEK zero check was made at 34 stations.

III. METHOD OF COLLECTION AND ANALYSIS OF SAMPLES

1. Physics

Temperature.- Water temperatures were taken with deep-sea reversing thermometers; protected thermometers with a range of -2°C to 30°C, and unprotected thermometers with a range of -2°C to 30°C, or -4°C to 60°C. The accuracy of the temperatures is considered to be ± 0.03 degC.

GEK.- The circuit and method of use were the same as given in CSIRO Aust. (1963). A course change lasting 4 min was made every hour, to obtain the total surface current.

Bathythermograms.- A 900 ft bathythermograph was used at each of the stations indicated in Table 1. Slides were digitized according to the method of the U.S. National Oceanographic Data Centre (1964) and the results transferred to punched cards.

Thermometric Depth.- Depth calculations were made by the method described by Pollak (1950), and are considered accurate to ± 15 m at depths greater than 1000 m, and to 1% above that depth.

Sigma-t.- Sigma-t values were calculated by computer from temperature and salinity values, using the equations of Knudsen (La Fond 1951).

2. Chemistry

Salinity.- Salinity was measured on board with an inductive salinometer (Brown and Hamon 1961).

Dissolved Oxygen.- A version of the standard Winkler method was used to determine the amount of dissolved oxygen in the sea-water samples. The version used is a modification of that described by Thompson and Robinson (1939) and differs in some respects from the version by Jacobsen, Robinson, and Thompson (1950). Potassium iodate was used at the iodometric standard and the reagents necessary to fix the oxygen in solution were used at different concentrations. Duplicate titrations were made on approximately every tenth sample. Saturation values were calculated, by computer, using the simpler of the equations given by Richards and Corwin (1956) -

$$\text{O}_2(\%) = \frac{\text{O}_2(\text{ml/l}) \times (33.5 + T^\circ\text{C}) \times 100}{332.4 - (1.854 \times S\%)} .$$

Inorganic Phosphate.- The method of Atkins (1923) was used with 1 ml molybdate reagent (300 ml 10% w/v ammonium molybdate and 100 ml 50% v/v sulphuric acid) and 0.1 ml 1% w/v stannous chloride diluted afresh from a 40% stock solution in hydrochloric acid, which was kept under paraffin. The reagents were automatically dispensed by a piston dispenser.

Standard phosphate solutions were made up in distilled water. At air temperatures less than 25°C, analyses were carried out in batches of 10; readings were begun within 10 min of adding reagents, and completed within 10 min. At air temperatures greater than 25°C, batches of 6 were analysed; readings were begun within 5 min of adding reagents and completed within 7 min. Each batch was compared with a distilled water blank and a 0.65 µg-atom/l standard in a Hilger Spekker absorptiometer using 4 cm cells and Ilford 608 filters. Each day a complete calibration was made using standards up to 3.25 µg-atom/l. Results are given as µg-atom/l without any correction for salt error and are precise to $\pm 10\%$ for values less than 0.5 µg-atom/l and $\pm 5\%$ for higher values. To correct for salt effects, the results given can be multiplied by 1.15.

Total Phosphorus.- 100 ml samples were drawn from the Nansen bottles into 150 ml Pyrex conical flasks, 0.2 ml of 72% v/v perchloric acid was added and digestion at 200°-250°C carried out immediately on a sand tray. After evaporation of water, heating was continued until fuming of the salt residue commenced. The samples were then allowed to cool and 100 ml of distilled water and 2 drops of 2% w/v phenolphthalein were added. If alkaline, perchloric acid was added until a slight acidity persisted. The flasks were allowed to stand for about 24 hr to allow the salts to dissolve. Phosphate was then determined as described above for inorganic phosphate. Results are given as µg-atom/l, without salt correction. To correct for salt effects, the results given can be multiplied by 1.15.

Nitrate.- After collection, water samples were stored in plastic bottles and preserved with 2 drops of saturated HgCl₂. Nitrate was determined at Cronulla by the strychnidine method (Rochford 1947). The reagent was prepared by the addition of 0.64 g strychnidine to a litre of nitrate-free sulphuric acid. 5 ml of this reagent were added, with minimum agitation, to 5 ml seawater or standard nitrate solution. The standards were made up in a mixture of equal volumes of artificial seawater and nitrate-free sulphuric acid. The standards and samples were shaken to distribute the reagent, and the colour developed for 2 hr. The solutions were read in a Unicam SP 600 spectrophotometer at a wavelength of 530 mµ using a 5 mm cell. Samples with an

absorbance greater than that of the standard corresponding to 14.4 $\mu\text{g-atom/l}$ were diluted with artificial seawater - sulphuric acid mixture before reading. Results are given in $\mu\text{g-atom/l}$
