OCEANOGRAPHICAL STATION LIST
ONSHORE HYDROLOGICAL INVESTIGATIONS IN EASTERN AUSTRALIA
1942-50

Compiled by D. J. ROCHFORD

I. INTRODUCTION

With the cessation in 1942 of the deep-sea oceanographical work of F.R.V. Warreens along the eastern Australian coast, the hydrological work of the C.S.I.R.O. Fisheries Division was concentrated on the onshore and estuarine waters of this region. The onshore investigations were designed to give information on the seasonal changes in hydrological conditions in eastern Australian coastal waters as described by Dakin and Colefax (1935) and on the long-term changes in nutrients, and in particular phosphates, that Cooper (1948) has suggested are responsible for fluctuations in fish stocks in the English Channel and adjacent seas. Moreover, it was hoped that the parallel investigations of onshore and estuarine hydrological conditions would yield information upon the effect of runoff from estuaries on seasonal changes in onshore waters.

The data have been collected from a series of stations along the coast of New South Wales, Victoria, and Tasmania (see Fig. 1). Table 1 indicates the position of each station and the date of commencement of observations.

TABLE 1

| Station | Latitude | Longitude | Date of Commencement of Observations |
|--------------------|----------|--------------|--------------------------------------|
| New South Wales | | | |
| Coff's Harbour | 30°17'S. | 150°16'E. | 26. x.1948 |
| Port Macquarie | 30°56'S. | 150°10'E. | 23. xi.1948 |

| Cape Pillar | 43°13'S. | 148°07'E. | 10. i.1945 |

II. METHODS

(i) *Temperature*.—Temperatures were taken with deep-sea reversing thermometers. In view of the shallow depth and the consequent small temperature lapse rate, no mercury expansion corrections have been applied to the temperature as read in the field.

In working from small boats during bad weather it was often difficult to read the thermometers with the requisite accuracy. The temperatures can, therefore, be considered reliable only to within ± 0.05 of the given figure.

(ii) *Chlorinity*.—Chlorinity was determined by the method described in Oceanographical Station List Volume 2 (1950). No salinity conversion of the chlorinity figures was attempted in view of the possible modifying effect of freshwater and estuarine drainage upon the Knudsen equation.

(iii) *Dissolved Oxygen*.—Methods used were described in Oceanographical Station List Volume 2.

(iv) *Phosphate Phosphorus*.—Methods used were described in Volume 2.

(v) *Organic Phosphorus*.—The method used was described by Rochford (1951).

(vi) *Nitrate Nitrogen*.—Detail of the method followed in these determinations by a modification of Harvey's reagent was given by Rochford (1947).

III. UNITS

Temperatures are in degrees centigrade. Chlorinity is in g./kg. Specific gravity is expressed as σ_t . Dissolved oxygen is given in ml./l. (20°C). Phosphate phosphorus and nitrate nitrogen are expressed as $\mu\text{g.P/l.}$ and $\mu\text{g.N/l.}$ (20°C) respectively.

IV. SUBDIVISION OF PHOSPHATE DATA

In most cases, two figures will be given under PO₄P. The first is the inorganic and the second the organic phosphate figure, determined as a difference between the total phosphate of the unfiltered water and its inorganic phosphate content.

In some cases, however, the method described by Rochford (1951) for a separation of the soluble and particulate fraction of the organic phosphate content has been followed. In these cases, three figures will be quoted in the PO₄P column. The first again is the inorganic, the second the soluble organic, and the last the particulate organic phosphate figure.

V. PERSONNEL

The laboratory analyses of these onshore data have been the responsibility of Mr. D. J. Rochford and the Cronulla hydrology staff. The field collections have in the main been carried out by Mr. C. Wirrell, Mr. H. Hollis, or Mr. C. Brown, without whose perseverance and loyalty the programme would have been impossible.
