OCEANOGRAPHICAL STATION LIST
ONSHORE PLANKTOLOGICAL INVESTIGATIONS IN EASTERN AUSTRALIA, 1945-54

Compiled by PATRICIA KOTT

I. INTRODUCTION

In association with the Division's hydrology programme, plankton collections have for many years been made at certain onshore stations along the east coast of Australia. Unfortunately collections made before 1945 are incomplete and records from 1945 and succeeding years only are available. For the years 1943-45 a survey from collections made at the Jibbon station has already been published (Sheard 1949).

II. STATIONS

Stations occupied along the New South Wales coast are those at Coff's Harbour, Port Macquarie, Port Stephens, Botany Bay, Jibbon, Ulladulla, and Eden (Rochford 1951); a station at Evans Head commenced in 1953; one series of hauls from Amity Point in Queensland; and occasional hauls from Sydney Heads. At all stations except Jibbon, collection has been made monthly; at Jibbon, however, the station has, since 1952, been occupied weekly where possible.

In addition to the stations mentioned above, F.R.V. "Derwent Hunter" in January 1954, while on a tuna cruise in the area, occupied stations at Eden, Ulladulla, Nobby's Head, Norah Head, Barranjoey Head, and Port Stephens as set out in Table 1.

TABLE 1

"Derwent Hunter" Station No.	Locality	Position

III. COLLECTION OF MATERIAL

N70 "Discovery"-type nets have been consistently used. Before 1952 15-minute horizontal hauls only were made, but since 1952 duplicate

vertical hauls from the bottom to the surface have been taken at all coastal stations, in addition to the usual 15-minute surface haul. At Port Stephens a winch is not available and there two horizontal hauls are made, one at the surface (0 m) and one at 2-5 metres. At the "wide" stations occupied by the "Derwent Hunter" layered vertical hauls are made with the N70 closing net from the bottom, through various depths, to the surface.

IV. LABORATORY TREATMENT OF MATERIAL

Counts are made of all individuals in one-tenth of the haul (Kott 1953), except where the haul is not sufficiently rich, when the total haul is counted. All Appendicularia, Acopa, Copepoda, and Cladocera are identified.

V. PRESENTATION OF DATA

Data are presented in the following columns:

F1	Fish larvae	E	Euphausiids
Fe	Fish eggs	Co	Copepods
Ap	Appendicularia	Cl	Cladocera
Ac	Acopa	Ch	Chaetognaths

There is an additional column for miscellaneous forms which are not covered by the headings set out above.

Under the heading "Station" the following information is given (where it exists in the records):

Location
Date
Depth
Time

Quantities are given as x where:

$$x = 1-10$$

$$x^2 = 100$$

$$4x^3 = 4000$$

x^n = swarms present

Indications of numbers present are followed by a key letter for the dominant and subdominant species, in that order. Unfortunately it is expedient to mention in these records only the three most plentiful copepods occurring in each haul.

Index letters for species occurring:

VI. ACKNOWLEDGMENTS

Thanks are due to Mr. D. J. Rochford, of this Division, who made his field staff available to take the hauls; to the hydrological field staff themselves, who in many adverse conditions maintained the stations; and to Mrs. P. Wyllie, who assisted greatly in the compilation of these lists.
