Investigations by F.R.V. Lancelin
in Western Australian Waters in 1963

I. INTRODUCTION

This report records the hydrological data collected during two months' work in Western Australian waters by F.R.V. Lancelin in 1963.

The cruise was planned to investigate the spawning of Western Australian salmon. Track charts and station positions are given in Figures 1 (a)-(e).

II. WORK ACCOMPLISHED

Ninety-five stations were worked. Surface samples were taken at 54 stations, and subsurface temperatures were taken at 41 stations. Surface horizontal plankton tows were made at 95 stations; horizontal plankton tows-underway samples were taken at 82 stations. The cruise was staffed by Messrs I.S.R. Munro and R. Favelle.

III. METHOD OF COLLECTION AND ANALYSIS OF SAMPLES

1. Physics

Temperature.—Surface temperatures were taken with a fisherman's thermometer (Vaux 1961). Subsurface temperatures were taken with a deep-sea reversing-thermometer; the values are uncorrected for index error and expansion of the mercury column after reversal of the thermometer. Surface and subsurface temperatures are considered accurate to about ± 0.2 degC.

Sigma-t.—Sigma-t values were computed from temperature and salinity values using the equations of Knudsen (La Fond 1951).

2. Chemistry

Salinity.—Sea-water samples were analysed at Cronulla for chlorinity, by a meter of the conductivity type (Hamon 1956). The results were converted to salinity by the relation -

$$\text{Salinity} = 0.03 + 1.805 \times \text{Chlorinity}$$

Salinities are considered accurate to about $\pm 0.05\%$.
