# 1 Summary

This voyage is an opportunity to undertake sea trials and calibrations linked to the 2025-26 long maintenance period, annual maintenance, and preparations for upcoming voyages. Typically, it aims to cover high-priority and some medium priority tasks identified by the Science Technology Integration Group (STIG) including:

- Vertical Sediment Winch, Seagoing Acceptance Testing – including spooling checks with weighted operations to 4,500m deployments (or deeper where possible).
- Giant Piston Corer operations and methods testing and calibration.
- NIWA Sled operations and methods testing and calibration.
- Deep Tow Camera deployments testing and calibration, including tests of onboard vehicle sonar for collision/object avoidance, as well as stop-and-drop deployment methods.
- CTD Modem functionality and methods checks.
- USBL Calibrations.
- Echosounder Backscatter Calibration and Correction validations and checks (BSCORR).

This report describes the production of quality controlled underway data from RV *Investigator* voyage IN2025\_E02.

To access the full voyage plan and other reports and data associated with this voyage, please see the contact information at the end of this report.

## 1.1 Voyage Track

Figure 1: Voyage track including daily ship positions

## 2 Data Processing

### 2.1 Background Information

Navigation data are acquired using the Kongsberg Seapath 380+ position and reference unit those data are differentially corrected by data from the Fugro Seastar 3610 DGNSS Receiver.

The meteorological data consist of two port/starboard relative humidity and temperature sensors, vane-type wind sensors, LI-COR photosynthetically active radiation (PAR, light) sensors and a barometric air pressure sensor.

Data from the Integrated Marine Observing System (IMOS) sensors are also included. The sensors are port and starboard radiometers and pyranometers, and ultrasonic wind speed and direction.

Refer to the Seagoing Instrumentation Report for this voyage for details of the instruments used and their serial numbers.

Navigation, meteorological, IMOS and Thermosalinograph (TSG) data are preliminarily quality controlled by combining all data from hourly recorded files into 5-second-averaged values in a NetCDF formatted file. The combined data are referred to as “*underway data*”.

A combined underway data file was made on the 21<sup>st</sup> August 2025 (UTC) by running the Java application UWYMerger (version 1.8.1) with a data time range of: 25-Jul-2025 21:28:45 to 01-Aug-2025 22:07:20 (UTC) using underway data from Techsas5.

Further, it should be noted that the merged data file contains additional underway sensor data that are not quality controlled or processed and are provided for completeness only. This includes data from the air sampling instruments (i.e., two ozone sensors, an absorption photometer, Picarro sensors and a sampling inlet bearing), a pCO<sub>2</sub> sensor, the drop keel position, the water depth and the gyroscopic compass.

For further descriptions of the instruments, their respective locations on the vessel and Underway NetCDF variables please refer to the Appendices at the end of this report.

## 2.2 Completeness and Data Quality

Navigation data (latitude and longitude, speed over ground, ship heading and course over ground), meteorological data (port and starboard for each of air temperature, relative humidity, relative and true wind speed and direction, PAR, rain, and atmospheric pressure), IMOS data (port and starboard radiometers and pyranometers, ultrasonic relative and true wind direction and speed) and thermosalinograph (TSG) data (salinity and water temperature) were evaluated and quality controlled (QC'd). It should be noted that the underway NetCDF file contains the raw unQC'd data. Therefore, even though the QC'd variable may have been set to NaN or otherwise adjusted or filtered out, the raw data variable is always available in the NetCDF underway file. This is useful if the end-user wishes to apply a different QC or filtering methodology.

### Voyage Specific Data Issues:

1. No issues found with the data, all instruments worked well.

## 2.3 Processing Comments

### 2.3.1 Atmospheric Pressure

No issues were found with the barometric sensor. The foremast digital barometer was used.

### 2.3.2 Air Temperature

No issues were found with the port and starboard air temperature data. Both instruments gave very close readings with a mean absolute difference of 0.14°C.

### 2.3.3 Latitude/Longitude

No issues were found with latitude and longitude data.

### 2.3.4 Humidity

No issues were found with the port and starboard humidity data. Both instruments gave very close readings with a mean absolute difference of 0.96%RH.

### 2.3.5 Rain

No issues were found with the port and starboard rain data. Note that any differences less than 1mm are ignored due to instrument accuracy.

### 2.3.6 Wind Speed & Direction

Minor discrepancies between the port and starboard vane wind speed and direction readings were noted, otherwise both sensors gave very close readings. It has been observed that due to the location of the port wind sensor relative to the ship's superstructure, the instrument could experience some interference when the wind direction is from the starboard stern (appx. 130 degrees). This results in greater fluctuations in both speed and direction measurements. Likewise, the starboard wind speed and direction sensor experiences similar interference when the wind direction is from the portside stern (appx. 240 degrees). Under these conditions, if the wind direction is either in range 120-140 or 230-250 degrees and the wind speed measurement has abruptly dropped by more than 14 knots due to obstruction by the superstructure, then the corresponding sensor data is flagged as bad and set to NaN for the port or starboard respectively. Furthermore, the value of 14 knots is estimated from the mean difference in wind speed between the port and starboard sensors when the wind direction is either approximately 120-140 degrees or 230-250 degrees plus 1 standard deviation.

### 2.3.7 Course Over Ground (courseOG) & Speed Over Ground (speedOG)

Ship position and speed (speedOG) are measured by differential GNSS using phase-smoothed pseudo-range and Doppler observations. When using high precision differential correction, a worldwide accuracy of 0.1-0.2 m is possible. Course over ground describes the direction of motion with respect to the ground that a vessel has moved relative to the geographic north pole. Accordingly, should a vessel be stationary, it is not travelling a course (e.g., at the wharf). Under conditions where a vessel is experiencing leeway (wind, current), a vessel's heading and courseOG may differ. This difference will typically be the largest for vessels moving at slow speeds. When the ship speed is less than 0.5 knots (25.7 cm/s), courseOG values fluctuate and are highly variable. Course and speed over the ground were recomputed from 5-second latitude and longitude values

(truncated to 6 decimal places, 0.000001 degree latitude = 11.112 cm). No issues were found with the ship's course over ground readings. The resulting course over ground values were compared to the original GPS-derived values and agreed well. When the values agree well, a slight smoothing is achieved when the ship is underway, and when the ship is almost stationary the result is similarly variable. Overall data quality is good.

### **2.3.8 Ship Heading**

No issues were found with the ship heading data.

### **2.3.9 Photosynthetically Active Radiation (PAR)**

Minor discrepancies between the port and starboard PAR sensor readings were noted and flagged as SUSPECT, otherwise both sensors gave very close readings. The portPAR baseline appears to be at 1  $\mu\text{E}/\text{m}^2/\text{s}$  instead of zero, this is likely due to a rounding off from 0.7 to 1.0 caused by background or stray noise, or calibration offset coefficient.

### **2.3.10 Pyranometer**

Minor discrepancies between the port and starboard Pyranometer sensor readings were noted and flagged as SUSPECT, otherwise both sensors gave very close readings. Please note that night-time observations can result in small negative offset readings ( $-7 \text{ W}/\text{m}^2$ ), these readings are still acceptable and within the specifications of the instrument.

### **2.3.11 Radiometer**

No issues were found with the port and starboard radiometer data. Both instruments gave very close readings with a mean absolute difference of  $1.5 \text{ W}/\text{m}^2$ .

### **2.3.12 Ultrasonic Wind Speed & Direction**

When the wind is approximately from the starboard stern of the ship (appx. 100-150 degrees), the ultrasonic wind direction values can exhibit wild variations (i.e., large spikes) which are not manifested by the two vane-type wind sensors to the same extent. It is believed that this characteristic is most likely caused by the interaction of the ship's superstructure, foremast, ship motion and the wind in relation to the ultrasonic wind sensor. Furthermore, when the wind direction is from the starboard stern and the wind speed measurement has abruptly dropped by more than 14 knots due to the superstructure obstruction, then the corresponding data is flagged as bad and set to NaN. Please note that the ultrasonic sensor is mounted in close proximity and just below the port wind vane sensor resulting in closer agreement when compared with the starboard wind vane sensor. Additionally, the value of 14 knots is estimated from the mean difference in wind speed between the ultrasonic and starboard sensors when the wind direction is approximately 100-150 degrees plus 1 standard deviation.

### 2.3.13 Water Temperature

No issues were found with the water temperature data.

### 2.3.14 Salinity

No issues were found with the salinity sensor readings. Please note that when the TSG pump is switched off (i.e., `tsgFlow` is low or close to zero) the salinity measurements start to drift, subsequently these are set to NaN and the QC flag set to BAD.

### 2.3.15 Thermosalinograph (TSG) Calibration

During the voyage, bottle salinity samples were collected from the underway seawater supply approximately every 2-3 days, and the precise time of each sample was recorded in EVERLog. A total of 9 bottle samples (in 3 triplicate sets) were collected and analysed. These values were compared with the underway salinity measured by the TSG at the exact same date/time and then used to calculate a conductivity scaling coefficient for the TSG using Multiple Linear Regression. This resulted in a scaling coefficient of 0.999552. The residual had a standard deviation (SD) of 0.0009073 PSU (better than the required  $\leq 0.01$  PSU). This was then applied to the salinity data, a QC flag was set, and the data state for each data point was set to either 'good', 'suspect', 'no QC' or 'bad'. See Table 3 in section 2.5 for further information on QC flags and data states.

Salinity bottle calibration data can be found in the following downloadable file: **IN2025\_E02\_UWY\_TSGCal\_BottleResults.csv**. Refer to Appendix 4.1 for plots of salinity and conductivity residuals.

### 2.3.16 TSG Lag

Examination and comparison of the TSG water temperature profile against the sea surface water temperature showed a lag of approximately 2.7 minutes (160 seconds) between the two data sets and a mean thermal increase of  $+0.179^{\circ}\text{C}$  from the intake keel to the TSG. This transport lag is due to the time taken for the water to flow from the water intake on the port drop keel (where sea surface water temperature is measured by the SBE38 sensor) to the TSG located in the underway seawater lab on the ship (where the TSG sensor measures the temperature and conductivity of the water pumped in from the drop keel intake). When the precise location for the TSG salinity measurement is critical, this lag needs to be accounted for to determine the exact geolocation of the sampled water. For example, assuming the ship is moving at 10 knots and it takes 2.7 minutes (transport lag) for the water to flow from the drop keel intake to the TSG, the TSG salinity measurements would be for a location about 823 meters away from the ship's location at the time of the TSG's measurements. The intake depths for the TSG and SBE38 SST intakes on the port drop keel are described in the Appendix. Additionally, the port drop keel depth extension was set to 2.0m for the entire voyage, the ship's draft is nominally at 6.0m, thus the TSG intake port is located  $6.0\text{m}+2.0\text{m}$  (8.0m) below the water line.

### 2.3.17 Depth

The water depth data are no longer processed as part of the underway data set. The non-QC'd depth data are available in the raw underway data. The QC'd water depth data may be obtained from the processed GSM dataset (centre beam) for this voyage.

### 2.3.18 Other Data Sets

#### Raw Underway Data

It should be noted that the underway NetCDF file contains the raw unQC'd data. Therefore, even though the QC'd variable may have been set to NaN or otherwise adjusted or filtered out, the raw data are always available in the QC'd underway file. This is useful if the end-user wishes to apply a different QC or filtering methodology.

### 2.3.19 Comparing Port and Starboard Sensors

The following table below compares the mean-absolute-differences and max-absolute-differences between port and starboard sensor outputs before and after QC has been applied. Please note that the **After QC** columns only account for values that are flagged as 'good'.

| Sensor                  | Before QC       |                | After QC        |                | Units                             |
|-------------------------|-----------------|----------------|-----------------|----------------|-----------------------------------|
|                         | mean(abs(diff)) | max(abs(diff)) | mean(abs(diff)) | max(abs(diff)) |                                   |
| Air Temperature         | 0.14            | 1.7            | 0.14            | 1.7            | degrees Celsius                   |
| Humidity                | 0.96            | 18.8           | 0.96            | 18.8           | %RH                               |
| Relative Wind Speed     | 1               | 16.4           | 1               | 16.4           | knots                             |
| True Wind Speed         | 1.65            | 16.78          | 1.65            | 15.46          | knots                             |
| Relative Wind Direction | 15.49           | 179.82         | 15.34           | 172.93         | degrees                           |
| True Wind Direction     | 15.01           | 178.02         | 14.94           | 164.52         | degrees                           |
| PAR                     | 19.45           | 951            | 19.14           | 951            | $\mu\text{E}/\text{m}^2/\text{s}$ |
| Pyranometer             | 10.41           | 468.8          | 9.85            | 468.8          | $\text{W}/\text{m}^2$             |
| Radiometer              | 1.49            | 9.6            | 1.49            | 9.6            | $\text{W}/\text{m}^2$             |
| Rain                    | 0.02            | 0.57           | 0.02            | 0.57           | mm                                |

Table 1: Port and starboard sensor statistics before and after QC

## 2.4 Final Underway Data

The following table below provides a list of sensor names, the corresponding QC flag name and percentage GOOD, SUSPECT, BAD and MISSING data.

|    | Parameter Name          | parameterQC               | % Good | % Suspect | % Bad | % Missing |
|----|-------------------------|---------------------------|--------|-----------|-------|-----------|
| 1  | latitude                | latitudeQC                | 100    | 0         | 0     | 0         |
| 2  | longitude               | longitudeQC               | 100    | 0         | 0     | 0         |
| 3  | speedOG                 | speedOGQC                 | 100    | 0         | 0     | 0         |
| 4  | courseOG                | courseOGQC                | 100    | 0         | 0     | 0         |
| 5  | shipHeading             | shipHeadingQC             | 100    | 0         | 0     | 0         |

Table 2: Final underway (CSV) QC'd data

## 2.5 Commonly Used QC Flags

The underway datasets include quality control (QC) flags which are described in more detail in reference (Pender, 2000). Normally however only a small subset is used. Below are the most commonly used QC flags. Please note that on some systems and file formats, e.g., NetCDF, it is not possible to store unsigned byte values. In this case, flags greater than 127 are stored as negative numbers. To convert them to unsigned integers, simply add 256.

| Signed | Unsigned | Description               | Data State | Operation Type    | Error Type                                |
|--------|----------|---------------------------|------------|-------------------|-------------------------------------------|
| -123   | 133      | Bad (data are set to NaN) | Bad        | None              | Error Flagged by processor                |
| 0      | 0        | Good                      | Good       | None              | No error, data are good                   |
| -187   | 69       | Suspect (data unchanged)  | Suspect    | None              | Error flagged by processor                |
| -135   | 121      | Operator adjusted         | Suspect    | Manually adjusted | Data out of range                         |
| -115   | 141      | Data missing              | Bad        | None              | No data, missing for an unknown reason    |
| -53    | 203      | Not QC'd                  | No QC      | None              | Preliminary processing (calibration) only |
| -199   | 57       | Operator adjusted         | Good       | Manually Adjusted | Data out of range                         |

Table 3: QC flag descriptions

## 2.6 Final Distribution Dataset Files

The final datasets for publication and distribution: The navigation, meteorological and Thermosalinograph data are entered into the O&A divisional data warehouse. All data timestamps are in UTC. Please note that the csv files contain only the QC'd variables listed in [Table 4](#).

| File Name                               | Description                                                               |
|-----------------------------------------|---------------------------------------------------------------------------|
| IN2025_E02_UWY_5sec.csv                 | 5-second resolution CSV format dataset of QC'd parameters                 |
| IN2025_E02_UWY_10sec.csv                | 10-second resolution CSV format (interpolated) dataset of QC'd parameters |
| IN2025_E02_UWY_1min.csv                 | 1-minute resolution CSV format (interpolated) dataset of QC'd parameters  |
| IN2025_E02_UWY_5min.csv                 | 5-minute resolution CSV format (interpolated) dataset of QC'd parameters  |
| IN2025_E02_UWY.nc                       | 5-second resolution in NetCDF format full dataset including unQC'd data   |
| IN2025_E02_UWY.mat                      | 5-second resolution in MATLAB format full dataset including unQC'd data   |
| IN2025_E02_UWY_TSGCal_BottleResults.csv | TSG Salinity calibration sample bottle data                               |
